Reason for Allowance

1. Regarding claims 1-9, and 16-24, the prior art fails to teach or suggest a method for routing in a peer-to-peer network, the method comprising a step that if an entry is found on the jump table which associates a destination zone with a next unresolved grouping of bits in the fixed portion of the hash key, then routing the message to the destination zone associated with the fixed portion of the hash key , in combination with other limitations, as specified in the independent claims 1, and 16.

Regarding claims 10-15, the prior art fails to teach or suggest a method for use in a peer-to-peer network, the method comprising the steps of associating a fixed portion of hash keys of a hash function with one of a plurality of zones in the peer-to-peer network, where each hash key generated from the hash function is associated with an object in the peer-to-peer network and where the fixed portion of the hash key comprises a string of bits that is further grouped into a number of disjoint groupings of bits; and maintaining state for each zone in the peer-to-peer network regarding the groupings of bits so as to route messages to a destination zone in the peer-to-peer network in a fixed path length, as specified in the independent claim 10.

Regarding claims 25-28, the prior art fails to teach or suggest a node for a peer-to-peer network comprising a second interface to at least one storage device, the second interface storing objects on the storage device where each object stored at the node is associated with a hash key of a hash function where each hash key has a fixed portion associated with a zone of the peer-to-peer network hosted at the node; and a routing processor which can route messages in the peer-

to-peer network using the first interface and the state stored on the memory unit so that a message can be routed to a destination zone in the peer-to-peer network in a fixed path length, in combination with other limitations, as specified in the independent claim 25.
